1   The Model

There are two players, a sender and a receiver, and a state of nature $q \in [0, 1]$ that is known to the sender but not the receiver. Let g denote the density of q. The sender sends an *intended* message $m(q) \in [0, 1]$. The receiver receives a noisy version of the intended message, which we call the *received* message, $\widetilde{m} = m(q) + e$. e is distributed according to a continuous density f with support $[-\overline{e}, \overline{e}]$, where for some integer $N \geq 2$, $\overline{e} = \frac{1}{2N}$.

We specify f as follows. Let $x : [-\overline{e}, \overline{e}] \to [0, 1]$ be given by

$$x(e) = \frac{1}{2} \left[1 + \frac{e}{\overline{e}} \right] \tag{1}$$

Consider, as an example, the Beta PDF:

$$f(e) = x(e)^{a-1}(1 - x(e))^{b-1} \tag{2}$$

for constants $a > 0$ and $b > 0$. The receiver then takes an action $a(\widetilde{m}) \in [0, 1]$. Both sender and receiver have utility over the state, q, and the receiver's action, a, of

$$U(q, a) = -\frac{1}{2}(q - a)^2 \tag{3}$$

Prior to the start of the game, the sender can specify an intended message function $m(q)$ that she will use. The receiver chooses an action based upon the function $m(q)$ and the received message $\widetilde{m}$, and we denote this function $a(\widetilde{m})$. We work backward and start with

the optimal action, given $m(q)$ and $\widetilde{m}$.

Fix a message function m. Let $Q(\widetilde{m})$ denote the set of all states $q \in [0, 1]$ such that for some noise $e \in [-\bar{e}, \bar{e}]$, $\widetilde{m} = m(q) + e$. In set builder notation,

$$Q(\widetilde{m}) = \{q \in [0,1] \mid m(q) - \bar{e} \le \widetilde{m} \le m(q) + \bar{e}\}. \tag{4}$$

Finally, define

$$q_+(\widetilde{m}) \equiv \sup Q(\widetilde{m}) \tag{5}$$

$$q_-(\widetilde{m}) \equiv \inf Q(\widetilde{m}) \tag{6}$$

$q_+(\widetilde{m})$ and $q_-(\widetilde{m})$ are the highest and lowest states that could possibly be associated with the received message $\widetilde{m}$. Define

$$I(\widetilde{m}; \alpha, \beta, \gamma) \equiv \int_{\alpha}^{\beta} q^\gamma f(\widetilde{m} - m(q))g(q)dq \tag{7}$$

Suppose that the receiver receives the message $\widetilde{m} \in [-\bar{e}, 1+\bar{e}]$. $q|\widetilde{m}$ has support $[q_-(\widetilde{m}), q_+(\widetilde{m})]$ and density

$$g(q|\widetilde{m}) = \frac{f(\widetilde{m} - m(q))g(q)}{\int_0^1 f(\widetilde{m} - m(t))g(t)dt} \tag{8}$$

The receiver's problem is to

$$\max_{a(\widetilde{m})} \int_{q_-(\widetilde{m})}^{q_+(\widetilde{m})} U(q, a)g(q|\widetilde{m})dq. \tag{9}$$

The receiver's optimal action is simply the expected value of the state, q, given the received message $\widetilde{m}$:

$$a(\widetilde{m}) = \int_{q_-(\widetilde{m})}^{q_+(\widetilde{m})} qg(q|\widetilde{m})dq = \frac{I(\widetilde{m}; q_-(\widetilde{m}), q_+(\widetilde{m}), 1)}{I(\widetilde{m}; q_-(\widetilde{m}), q_+(\widetilde{m}), 0)} \tag{10}$$

It will be helpful to refer to the *cost* of a message function. Let the cost functional C be given by

$$\mathcal{C}[m] \equiv \int_0^1 \int_{-\bar{e}}^{\bar{e}} (q - a(m(q) + e))^2 f(e) ded q, \tag{11}$$

2

where a is the receiver's optimal action from Equation (10). $\mathcal{C}[m]$ is the expected loss for a given message function m. The integrand is the loss for a given state q and action $a(\widetilde{m})$. The interior integral integrates over the possible exogenous errors, to generate the expected loss given the state. The exterior integral integrates over possible states. Therefore, the *sender's problem* is to choose a message function m that minimizes $\mathcal{C}[m]$:

$$\min_{m \in M} \mathcal{C}[m] \tag{12}$$

where M is the space of weakly increasing piece-wise continuous functions on $[0, 1]$. The change of variables $\widetilde{m} = m(q) + e$ and an application of Fubini's Theorem yield

$$\mathcal{C}[m] = \int_0^1 \int_{m(q)-\bar{e}}^{m(q)+\bar{e}} (q - a(\widetilde{m}))^2 f(\widetilde{m} - m(q)) g(q) d\widetilde{m} dq \tag{13}$$

$$= \int_{-\bar{e}}^{1+\bar{e}} \int_{q_-(\widetilde{m})}^{q_+(\widetilde{m})} (q - a(\widetilde{m}))^2 f(\widetilde{m} - m(q)) g(q) dq d\widetilde{m}. \tag{14}$$

We consider the costs of identity ("$\mathcal{I}$") and discrete ("$\mathcal{D}$") message functions.

2   Identity Message

We consider the identity message function, $m(q) = q$, only for the case in which q is uniformly distributed.

$$a(\widetilde{m}) = \begin{cases} \overline{a}(\widetilde{m}) & \text{if } 1 - \bar{e} < \widetilde{m} \leq 1 + \bar{e} \\ a(\widetilde{m}) & \text{if } \bar{e} < \widetilde{m} \leq 1 - \bar{e} \\ \underline{a}(\widetilde{m}) & \text{if } -\bar{e} \leq \widetilde{m} \leq \bar{e} \end{cases} \tag{15}$$

where

$$\overline{a}(\widetilde{m}) = \frac{I(\widetilde{m}; \widetilde{m} - \bar{e}, 1, 1)}{I(\widetilde{m}; \widetilde{m} - \bar{e}, 1, 0)} \tag{16}$$

$$a(\widetilde{m}) = \frac{I(\widetilde{m}; \widetilde{m} - \bar{e}, \widetilde{m} + \bar{e}, 1)}{I(\widetilde{m}; \widetilde{m} - \bar{e}, \widetilde{m} + \bar{e}, 0)} \tag{17}$$

$$\underline{a}(\widetilde{m}) = \frac{I(\widetilde{m}; 0, \widetilde{m} + \bar{e}, 1)}{I(\widetilde{m}; 0, \widetilde{m} + \bar{e}, 0)} \tag{18}$$

Note that the normalizing constant cancels out when computing the conditional expectation. The cost of the identity message function is given by

$$
\mathcal{C}[m_{\mathcal{I}}] = \int_{-\bar{e}}^{1+\bar{e}} \int_{q_-(\widetilde{m})}^{q_+(\widetilde{m})} (q - a(\widetilde{m}))^2 f(\widetilde{m} - q) dq d\widetilde{m}. \tag{19}
$$

where $q_+(\widetilde{m}) = \min\{\widetilde{m} + \bar{e}, 1\}$ and $q_-(\widetilde{m}) = \max\{\widetilde{m} - \bar{e}, 0\}$. Define

$$
\overline{z} = \int_{1-\bar{e}}^{1+\bar{e}} \int_{\widetilde{m}-\bar{e}}^{1} (q - \overline{a}(\widetilde{m}))^2 f(\widetilde{m} - q) dq d\widetilde{m} \tag{20}
$$

$$
z = \int_{\bar{e}}^{1-\bar{e}} \int_{\widetilde{m}-\bar{e}}^{\widetilde{m}+\bar{e}} (q - a(\widetilde{m}))^2 f(\widetilde{m} - q) dq d\widetilde{m} \tag{21}
$$

$$
\underline{z} = \int_{-\bar{e}}^{\bar{e}} \int_{0}^{\widetilde{m}+\bar{e}} (q - \underline{a}(\widetilde{m}))^2 f(\widetilde{m} - q) dq d\widetilde{m} \tag{22}
$$

so that $\mathcal{C}[m_{\mathcal{I}}] = \overline{z} + z + \underline{z}$.

3 Discrete Message

3.1 Setup

Fix an integer $M \geq 1$ and define $K = M \times N$. Define $\bar{d} = \frac{1}{2K}$. Consider the partition

$$
0 = x_0 < x_1 < \cdots < x_K < x_{K+1} = 1 \tag{23}
$$

of $[0, 1]$. Let $x = (x_0, \ldots, x_{K+1})$. For each $i \in \{0, \ldots, K\}$, define $X_i = [x_i, x_{i+1})$. A discrete message with $K + 1$ messages is given by

$$
m_{\mathcal{D}}(q) = \sum_{i=0}^{K} \frac{i}{K} \chi_{X_i}(q) \tag{24}
$$

(where χ is the characteristic function). Let $k_- : [-\bar{e}, 1 + \bar{e}] \to \{0, \ldots, K\}$ and $k_+ : [-\bar{e}, 1 + \bar{e}] \to \{1, \ldots, K + 1\}$ be given by

$$k_+(\widetilde{m}) = \min\{\lfloor \widetilde{m}K \rfloor + M + 1, K + 1\} \tag{25}$$

$$k_-(\widetilde{m}) = \max\{0, \lfloor \widetilde{m}K \rfloor - M\} \tag{26}$$

respectively. Note that

$$q_+(\widetilde{m}) = x_{k_+(\widetilde{m})} \tag{27}$$

$$q_-(\widetilde{m}) = x_{k_-(\widetilde{m})} \tag{28}$$

There are

$$\frac{1 + 2\bar{e}}{2\bar{d}} = M + K \tag{29}$$

unique actions (corresponding to $M + K$ equispaced subintervals of $[-\bar{e}, 1 + \bar{e}]$). For each $i \in \{-M, \ldots, K - 1\}$, define

$$y_i = 2\bar{d}(i + M) - \bar{e} \tag{30}$$

$$Y_i = [y_i, y_{i+1}) \tag{31}$$

so that for each $y \in Y_i$,

$$k_+(y) = k_+(y_i) = \min\{i + M + 1, K + 1\} \tag{32}$$

$$k_-(y) = k_-(y_i) = \max\{0, i + 1\} \tag{33}$$

3.2 Message Cost

Note that $y_{i+1} = y_i + 2\bar{d}$. For $i \in \{-M, \ldots, K - 1\}$ and $j \in \{0, \ldots, K + 1\}$, let

$$\alpha_{i+1,j+1} \equiv \int_{y_{i+1}}^{y_{i+2}} f(\widetilde{m} - 2\bar{d}(j + 1))d\widetilde{m} \tag{34}$$

$$= \int_{y_i + 2\bar{d}}^{y_{i+1} + 2\bar{d}} f((\widetilde{m} - 2\bar{d}) - 2\bar{d}j)d\widetilde{m} \tag{35}$$

$$= \int_{y_i}^{y_{i+1}} f(\widetilde{m} - 2\bar{d}j)d\widetilde{m} = \alpha_{i,j} \tag{36}$$

Moreover, A is sparse:

$$\alpha_{i,j} = \int_{y_i}^{y_{i+1}} f(\widetilde{m} - 2\bar{d}j)d\widetilde{m} \tag{37}$$

$$= \int_{y_i}^{y_{i+1}} f(\widetilde{m} - 2\bar{d}j)\mathbf{1}_{-\bar{e} \leq \widetilde{m} - 2\bar{d}j \leq \bar{e}}d\widetilde{m} \tag{38}$$

$$= \int_{y_i}^{y_{i+1}} f(\widetilde{m} - 2\bar{d}j)\mathbf{1}_{2\bar{d}j - \bar{e} \leq \widetilde{m} \leq 2\bar{d}j + \bar{e}}d\widetilde{m} \tag{39}$$

$$= \int_{y_i}^{y_{i+1}} f(\widetilde{m} - 2\bar{d}j)\mathbf{1}_{y_{j-M} \leq \widetilde{m} \leq y_j}d\widetilde{m} \tag{40}$$

$$= \mathbf{1}_{j-M \leq i < j} \int_{y_i}^{y_{i+1}} f(\widetilde{m} - 2\bar{d}j)d\widetilde{m} \tag{41}$$

Note that when the error is uniformly distributed, The cost is given by

$$\mathcal{C}[m_{\mathcal{D}}] = \int_{-\bar{e}}^{1+\bar{e}} \left[\int_{x_{k_-(\widetilde{m})}}^{x_{k_+(\widetilde{m})}} (q - a(\widetilde{m}))^2 f(\widetilde{m} - m_{\mathcal{D}}(q))g(q)dq \right] d\widetilde{m}. \tag{42}$$

$$= \int_{-\bar{e}}^{1+\bar{e}} \left[\sum_{j=k_-(\widetilde{m})}^{k_+(\widetilde{m})-1} \int_{x_j}^{x_{j+1}} (q - a(\widetilde{m}))^2 f\left(\widetilde{m} - \frac{j}{K}\right) g(q)dq \right] d\widetilde{m} \tag{43}$$

$$= \sum_{i=-M}^{K-1} \int_{y_i}^{y_{i+1}} \left[\sum_{j=k_-(y_i)}^{k_+(y_i)-1} \int_{x_j}^{x_{j+1}} (q - a_i)^2 f\left(\widetilde{m} - \frac{j}{K}\right) g(q)dq \right] d\widetilde{m} \tag{44}$$

$$= \sum_{i=-M}^{K-1} \int_{y_i}^{y_{i+1}} \left[\sum_{j=k_-(y_i)}^{k_+(y_i)-1} \int_{x_j}^{x_{j+1}} (q - a_i)^2 f\left(\widetilde{m} - \frac{j}{K}\right) g(q)dq \right] d\widetilde{m} \tag{45}$$

$$= \sum_{i=-M}^{K-1} \sum_{j=k_-(y_i)}^{k_+(y_i)-1} \left[\int_{y_i}^{y_{i+1}} \int_{x_j}^{x_{j+1}} (q - a_i)^2 f\left(\widetilde{m} - \frac{j}{K}\right) g(q)dqd\widetilde{m} \right] \tag{46}$$

$$= \sum_{i=-M}^{K-1} \sum_{j=k_-(y_i)}^{k_+(y_i)-1} \left[\alpha_{i,j} \int_{x_j}^{x_{j+1}} (q - a_i)^2 g(q)dq \right] \tag{47}$$

$$= \sum_{j=0}^{K} \sum_{i=j-M}^{j-1} \left[\alpha_{i,j} \int_{x_j}^{x_{j+1}} (q - a_i)^2 g(q)dq \right] \tag{48}$$

6

Equations 47 and 48 provide two different characterizations of $\mathcal{C}[m_{\mathcal{D}}]$.

3.3 First-Order Conditions

Define

$$\beta_\gamma(x_i, x_{i+1}) = \int_{x_i}^{x_{i+1}} q^\gamma g(q) dq. \tag{49}$$

For $i = -M, \ldots, K-1$ and $j = 1, \ldots, K$, the first-order conditions for a_i and x_j are

$$0 = \frac{\partial}{\partial a_i} \mathcal{C}[m_{\mathcal{D}}] = -2 \sum_{k=k_-(y_i)}^{k_+(y_i)-1} \alpha_{i,k} \int_{x_k}^{x_{k+1}} (q - a_i) g(q) dq \tag{50}$$

$$0 = \frac{\partial}{\partial x_j} \mathcal{C}[m_{\mathcal{D}}] = \sum_{i=j-1-M}^{j-2} \alpha_{i,j-1}(x_j - a_i)^2 g(x_j) - \sum_{i=j-M}^{j-1} \alpha_{i,j}(x_j - a_i)^2 g(x_j) \tag{51}$$

respectively. If $g(x_i) > 0$, then for $j = 1, \ldots, K$, we have

$$0 = \sum_{i=j-1-M}^{j-2} (x_j - a_i)^2 \alpha_{i,j-1} - \sum_{i=j-M}^{j-1} (x_j - a_i)^2 \alpha_{i,j} \tag{52}$$

$$= \sum_{i=j-1-M}^{j-2} \left((x_j - a_i)^2 \alpha_{i,j-1} - (x_j - a_{i+1})^2 \alpha_{i+1,j} \right) \tag{53}$$

$$= \sum_{i=j-1-M}^{j-2} \left(\left(x_j^2 - 2 a_i x_j - a_i^2 \right) \alpha_{i,j-1} - \left(x_j^2 - 2 a_{i+1} x_j - a_{i+1}^2 \right) \alpha_{i+1,j} \right) \tag{54}$$

$$= x_j^2 \left[\sum_{i=j-1-M}^{j-2} (\alpha_{i,j-1} - \alpha_{i+1,j}) \right] - 2 x_j \left[\sum_{i=j-1-M}^{j-2} (a_i \alpha_{i,j-1} - a_{i+1} \alpha_{i+1,j}) \right]$$

$$+ \left[\sum_{i=j-1-M}^{j-2} \left(a_i^2 \alpha_{i,j-1} - a_{i+1}^2 \alpha_{i+1,j} \right) \right] \tag{55}$$

$$= -2 x_j \left[\sum_{i=j-1-M}^{j-2} (a_i \alpha_{i,j-1} - a_{i+1} \alpha_{i+1,j}) \right] + \left[\sum_{i=j-1-M}^{j-2} \left(a_i^2 \alpha_{i,j-1} - a_{i+1}^2 \alpha_{i+1,j} \right) \right] \tag{56}$$

7

Let the (i,j)-the element of the matrix $B \in \mathbb{R}^{(M+K) \times K}$ be given by

$$[B]_{i,j} = \begin{cases} \alpha_{j-1-M,j-1} & \text{if } j-1-M = i \\ \alpha_{i,j-1} - \alpha_{i,j} & \text{if } j-1-M < i < j-1 \\ -\alpha_{j-1,j} & \text{if } i = j-1 \\ 0 & \text{otherwise} \end{cases} \tag{57}$$

so that

$$0 = \mathcal{F}(\tilde{x}, a) := -2(B'a) \circ \tilde{x} + B'a^{\circ 2} \tag{58}$$

where $\circ$ denotes Hadamard multiplication, $u = (1, \ldots, 1)' \in \mathbb{R}^{K+M}$, $\tilde{x} = (x_1, \ldots, x_K)' \in \mathbb{R}^K$, and $\mathcal{F} : \mathbb{R}^K \times \mathbb{R}^{M+K} \to \mathbb{R}^K$.

3.4   Uniformly Distributed State

In what follows, suppose that $g(q) = \chi_{[0,1]}(q)$. Equation 50 becomes

$$0 = \left[\sum_{k=k_-(y_i)}^{k_+(y_i)-1} \alpha_{i,k} \left(x_{k+1}^2 - x_k^2 \right) \right] - 2a_i \left[\sum_{k=k_-(y_i)}^{k_+(y_i)-1} \alpha_{i,k} (x_{k+1} - x_k) \right] \tag{59}$$

Let the (i,j)-the element of the matrix $C \in \mathbb{R}^{(M+K) \times (K+2)}$ be given by

$$[C]_{i,j} = \begin{cases} -\alpha_{i,k_-(y_i)} & \text{if } k_-(y_i) = j \\ \alpha_{i,j-1} - \alpha_{i,j} & \text{if } k_-(y_i) < j < k_+(y_i) \\ \alpha_{i,k_+(y_i)-1} & \text{if } j = k_+(y_i) \\ 0 & \text{otherwise} \end{cases} \tag{60}$$

It transpires that for $i = -M, \ldots, K-1$ and $j = 1, \ldots, K$, $[B]_{i,j} = [C]_{i,j}$ (C is padded on both sides by an extra column):

$$C = \begin{bmatrix} \underline{c} & B & \bar{c} \end{bmatrix} \tag{61}$$

We have

$$0 = \mathcal{G}(x, a) := Cx^{\circ 2} - 2a \circ (Cx) \tag{62}$$

8

where $\mathcal{G} : \mathbb{R}^{K+2} \times \mathbb{R}^{M+K} \to \mathbb{R}^{M+K}$. Hence,

$$a = \frac{1}{2}(Cx^{\circ 2}) \oslash (Cx) \tag{63}$$

$$= \frac{1}{2}(B\widetilde{x}^{\circ 2} + \overline{c}) \oslash (B\widetilde{x} + \overline{c}) \tag{64}$$

where $\oslash$ denotes Hadamard division. To summarize, $\mathcal{F}(x, a) = 0$ is a system of K equations and $\mathcal{G}(x, a) = 0$ a system of $K + M$ equations. x contains K unknowns (since $x_0 = 0$ and $x_{K+1} = 1$) and a contains $K + M$ unknowns. In total, there are $M + 2K$ equations and $M + 2K$ unknowns.

$$0 = B'a^{\circ 2} - 2(B'a) \circ \widetilde{x} \tag{65}$$

$$0 = (Bx^{\circ 2} + \overline{c}) - 2(Bx + \overline{c}) \circ a \tag{66}$$

3.5 Example: A, B, and C when $M = 4$ an $N = 2$

$$A = \begin{bmatrix}
\alpha_{-4,0} & & & & & & & & \\
\alpha_{-3,0} & \alpha_{-3,1} & & & & & & & \\
\alpha_{-2,0} & \alpha_{-2,1} & \alpha_{-2,2} & & & & & & \\
\alpha_{-1,0} & \alpha_{-1,1} & \alpha_{-1,2} & \alpha_{-1,3} & & & & & \\
& \alpha_{0,1} & \alpha_{0,2} & \alpha_{0,3} & \alpha_{0,4} & & & & \\
& & \alpha_{1,2} & \alpha_{1,3} & \alpha_{1,4} & \alpha_{1,5} & & & \\
& & & \alpha_{2,3} & \alpha_{2,4} & \alpha_{2,5} & \alpha_{2,6} & & \\
& & & & \alpha_{3,4} & \alpha_{3,5} & \alpha_{3,6} & \alpha_{3,7} & \\
& & & & & \alpha_{4,5} & \alpha_{4,6} & \alpha_{4,7} & \alpha_{4,8} \\
& & & & & & \alpha_{5,6} & \alpha_{5,7} & \alpha_{5,8} \\
& & & & & & & \alpha_{6,7} & \alpha_{6,8} \\
& & & & & & & & \alpha_{7,8}
\end{bmatrix} \tag{67}$$

$$B = \begin{bmatrix}
& \alpha_{-4,0} & & & & & & \\
\alpha_{-3,0}-\alpha_{-3,1} & & \alpha_{-3,1} & & & & & \\
\alpha_{-2,0}-\alpha_{-2,1} & \alpha_{-2,1}-\alpha_{-2,2} & & \alpha_{-2,2} & & & & \\
\alpha_{-1,0}-\alpha_{-1,1} & \alpha_{-1,1}-\alpha_{-1,2} & \alpha_{-1,2}-\alpha_{-1,3} & & \alpha_{-1,3} & & & \\
-\alpha_{0,1} & \alpha_{0,1}-\alpha_{0,2} & \alpha_{0,2}-\alpha_{0,3} & \alpha_{0,3}-\alpha_{0,4} & \alpha_{0,4} & & & \\
& -\alpha_{1,2} & \alpha_{1,2}-\alpha_{1,3} & \alpha_{1,3}-\alpha_{1,4} & \alpha_{1,4}-\alpha_{1,5} & \alpha_{1,5} & & \\
& & -\alpha_{2,3} & \alpha_{2,3}-\alpha_{2,4} & \alpha_{2,4}-\alpha_{2,5} & \alpha_{2,5}-\alpha_{2,6} & \alpha_{2,6} & \\
& & & -\alpha_{3,4} & \alpha_{3,4}-\alpha_{3,5} & \alpha_{3,5}-\alpha_{3,6} & \alpha_{3,6}-\alpha_{3,7} & \alpha_{3,7} \\
& & & & -\alpha_{4,5} & \alpha_{4,5}-\alpha_{4,6} & \alpha_{4,6}-\alpha_{4,7} & \alpha_{4,7}-\alpha_{4,8} \\
& & & & & -\alpha_{5,6} & \alpha_{5,6}-\alpha_{5,7} & \alpha_{5,7}-\alpha_{5,8} \\
& & & & & & -\alpha_{6,7} & \alpha_{6,7}-\alpha_{6,8} \\
& & & & & & & -\alpha_{7,8}
\end{bmatrix} \tag{68}$$

$$C = \begin{bmatrix}
-\alpha_{-4,0} & & \alpha_{-4,0} & & & & & & & \\
-\alpha_{-3,0} & \alpha_{-3,0}-\alpha_{-3,1} & & \alpha_{-3,1} & & & & & & \\
-\alpha_{-2,0} & \alpha_{-2,0}-\alpha_{-2,1} & \alpha_{-2,1}-\alpha_{-2,2} & & \alpha_{-2,2} & & & & & \\
-\alpha_{-1,0} & \alpha_{-1,0}-\alpha_{-1,1} & \alpha_{-1,1}-\alpha_{-1,2} & \alpha_{-1,2}-\alpha_{-1,3} & & \alpha_{-1,3} & & & & \\
& -\alpha_{0,1} & \alpha_{0,1}-\alpha_{0,2} & \alpha_{0,2}-\alpha_{0,3} & \alpha_{0,3}-\alpha_{0,4} & \alpha_{0,4} & & & & \\
& & -\alpha_{1,2} & \alpha_{1,2}-\alpha_{1,3} & \alpha_{1,3}-\alpha_{1,4} & \alpha_{1,4}-\alpha_{1,5} & \alpha_{1,5} & & & \\
& & & -\alpha_{2,3} & \alpha_{2,3}-\alpha_{2,4} & \alpha_{2,4}-\alpha_{2,5} & \alpha_{2,5}-\alpha_{2,6} & \alpha_{2,6} & & \\
& & & & -\alpha_{3,4} & \alpha_{3,4}-\alpha_{3,5} & \alpha_{3,5}-\alpha_{3,6} & \alpha_{3,6}-\alpha_{3,7} & \alpha_{3,7} & \\
& & & & & -\alpha_{4,5} & \alpha_{4,5}-\alpha_{4,6} & \alpha_{4,6}-\alpha_{4,7} & \alpha_{4,7}-\alpha_{4,8} & \alpha_{4,8} \\
& & & & & & -\alpha_{5,6} & \alpha_{5,6}-\alpha_{5,7} & \alpha_{5,7}-\alpha_{5,8} & \alpha_{5,8} \\
& & & & & & & -\alpha_{6,7} & \alpha_{6,7}-\alpha_{6,8} & \alpha_{6,8} \\
& & & & & & & & -\alpha_{7,8} & \alpha_{7,8}
\end{bmatrix} \tag{69}$$
